

1. What problems did you encounter converting the book preview to a component?
Creating a dynamic web component that updated the Title, Author and Image from the data in the books array. I was trying to use `setAttribute` to set the attributes of the web component but that did not display on the component. So, I passed parameters into the constructor and called the class with the relevant parameters.
2. What other elements make sense to convert into web components? Why?
The buttons within the app. There are three of them. One can create a component instead of rewriting code for all three individually.
3. Why does keeping your HTML, CSS and JavaScript in a single file sometimes make sense?
It makes it easier for smaller projects or for a piece of logic that someone wants to test quickly before including in bigger applications.
